Drag your emotional reality

www.domus3d.com

Domus 3D 6.0 Version

is the design and estimating leader software
in the covering materials, furnishing and sanitaryware market,
used by most important retailers, designers, architects all over the world.
From design to estimate, a powerful tool to close rates and to convey products
arranged in catalogues that are constantly updated and available on-line.

Maticad®

Domus 3D 6.0 Version

What does it do ?

DomuS3D® 6.0 allows to draw or import a layout by displacing rooms with simple drag&drop actions in the designing area. In the same way, it is possible to place lots of 3D furnishing elements in the room, taking them from a rich products library that allows to decorate any kind of living space, including exteriors.

schemes, as you just have to tell the program the single items of the module and the program will then propagate this scheme to all the desired surfaces, without limitation of shape or area. Rooms that, little by little, take a more and more detailed and refined conformation, can be constantly monitored, in their final appearance, through the virtual navigation window, where it is possible to move inside, being also able to verify the smallest details of the job

Its specificity for coverings is such to offer a wide set of functions that goes from the simplest laying of floors and walls, up to compositions made of decorated areas, frames, mosaics, vertical layings, rose decorations, etc. Moreover, the presence of a wide-ranging library of automatic laying schemes makes it easy to create even the most complex

in progress. It is possible to get a higher level of graphic visualization thanks to the image generation in rendering mode that the program can perform, giving a great emotional and artistic impact. On the most pragmatic side regarding the efficiency in helping the sale and the realization of the project, DomuS3D® is greatly helpful as it is able to generate the metric calculation of used materials and the economic estimate, as well as technical printouts that include the exploded drawings of all tiled surfaces, in order to give the installer specific and detailed information. DomuS3D® can be integrated with the most widespread accounting software programs, in order to guarantee the full integration of the designing work within the

sale cycle and the warehouse management. Thanks to its 15 years experience in this market, DomuS3D® has become the leader and is widely widespread both in Italy and abroad: constant esteem messages, coming from resellers, confirm that, thanks to the use of the program, has been noticed a sensible increase of closing rates, because of the designing service offered to the final user.

Who is it for ?

For **Manufacturers**, (of covering materials, sanitaryware, furnishings) as a marketing vehicle to equip their retailers network with a multifunctional tool suitable to perform as an electronic catalog too, with integrated price list (optional).
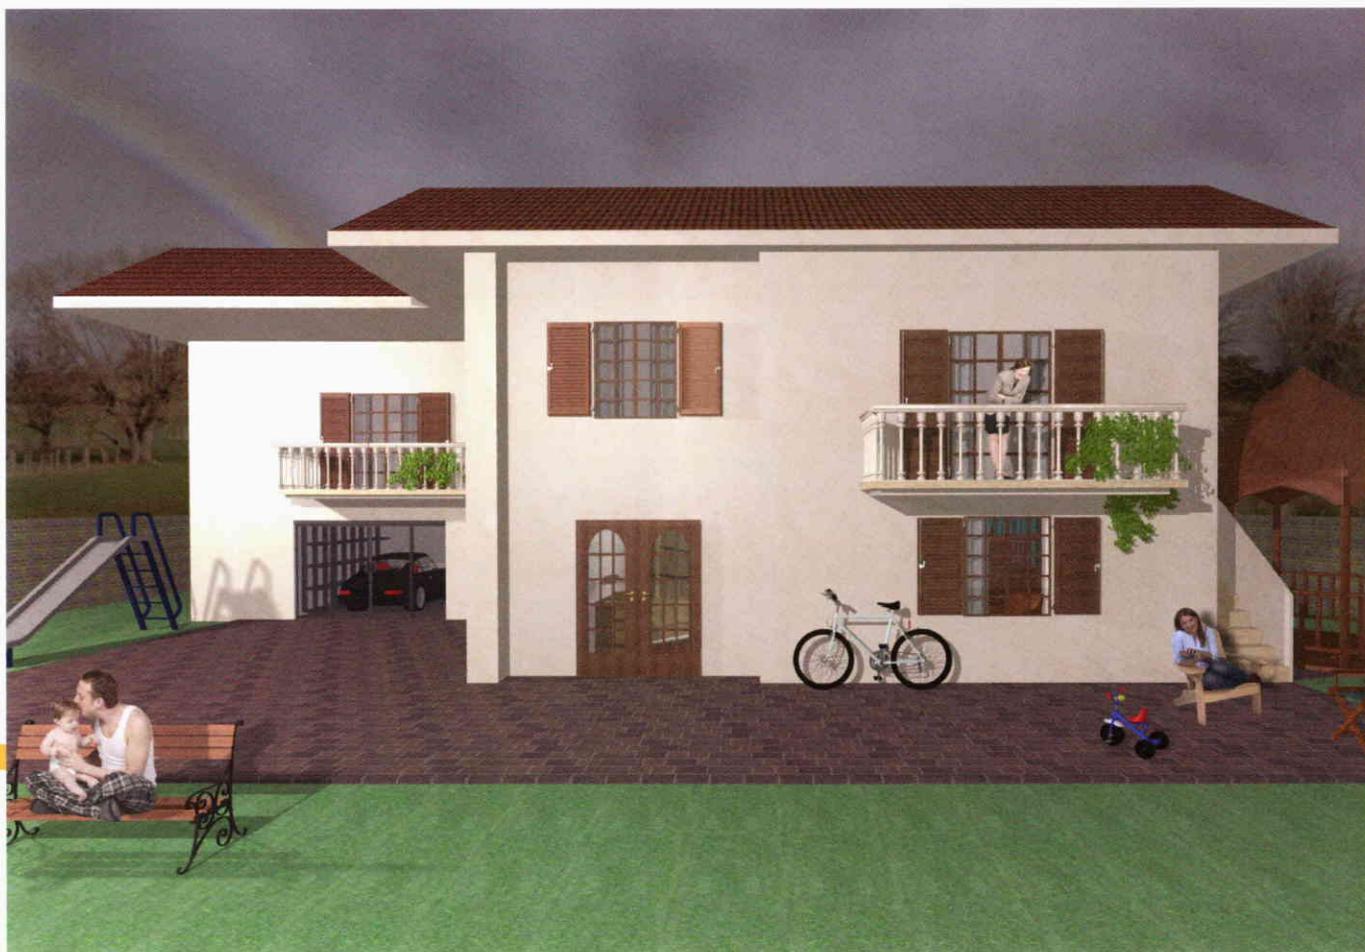

For **Retailers**, in order to offer their customers a qualified and qualifying service that helps, thanks to the virtual simulation, to visualize the final solution, hence to convince more easily the customers, as well as to give to the installers detailed technical printouts, reducing the risk to make mistakes.

For **Architects** and **Interior Designers**: for them the

flexibility of the platform, opened to 3D element import/export, allows to integrate it with other usual software tools, as to become an highly professional solution for the specific study of the laying subject. Just because of the fact that it works with real products libraries, the identification of the material and of its quantity, in the passage from the project to the operating phase, comes out consequently.

Available versions

In addition to the traditional **stand-alone** version, there is now, and it's becoming more and more popular, the **client-server** version that, as needs grow, is able to offer the solution for a more integrated and professional team work. DomuS3D® 6.0 client-server is the ideal solution for those who need more operating sites, who can share a unique tiles, panels, furnishing elements, projects, etc. database within a company network. It also allows to work in distinct locations, through VPN on the web. This is the case of companies that have more showrooms in different areas.

Technical requirements

Operating system: Windows 2000, XP, Vista[*]   [*]When it will be commercially available
Hardware (minimum):   Pentium 4 1.0 GHz., 512 MB Ram, 600 MB HD free, graphic card 128 MB
Hardware (recommended): Pentium 4 2.4 GHz. or higher, 1 GB Ram, 1 GB HD free, graphic card 256 MB
Optional (recommended): Sound card and Internet access
